

Kaiāulu

Anthony Lau, Ian Jaymes Iwata, Sean Sunoo

Sponsored by: Carlos Paradis and Rick Kazman

Technical Solution Overview

- What is Kaiaulu
 - Kaiaulu is open source: <https://github.com/sailuh/kaiaulu>
 - Data miner and analysis
 - R package that consists of notebooks, functions, config files
 - Written as part of a PhD thesis in UH Manoa
- Problem
 - No way to automatically update downloaded data
 - Need to manually download any new data
 - No overarching structure for file paths or config file organization
- Solution
 - Create functions that parse most recent data from already present files
 - Unify file path organization and universal file naming conventions
 - Create functions that call various REST API to retrieve new data
 - Write scripts which can be executed from the command line by Cron Jobs

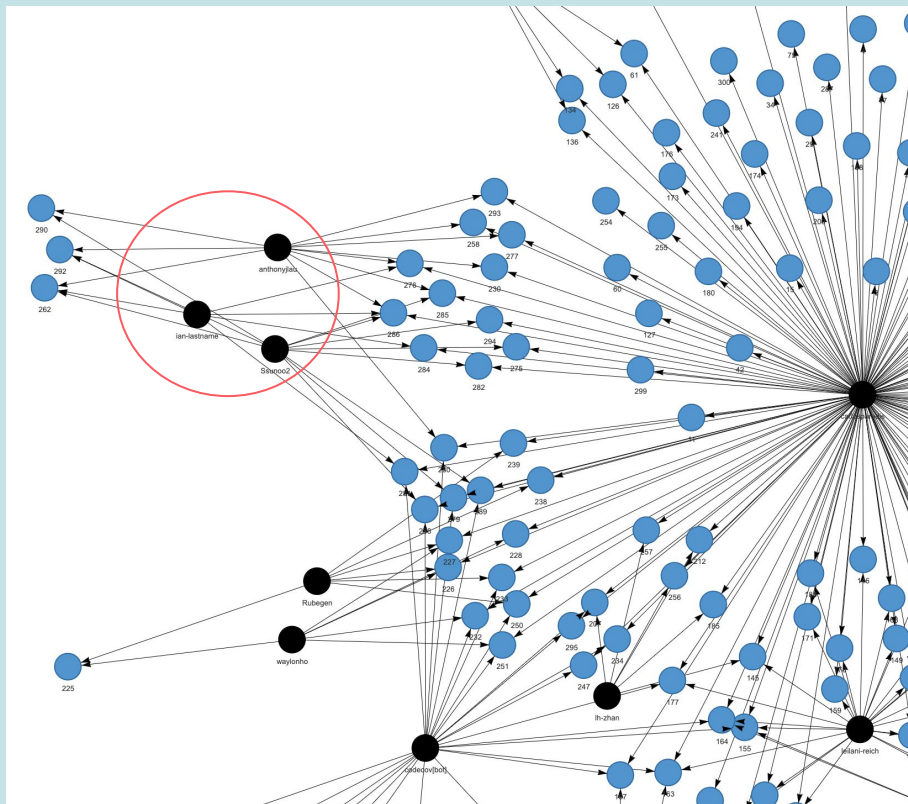

Major Accomplishments

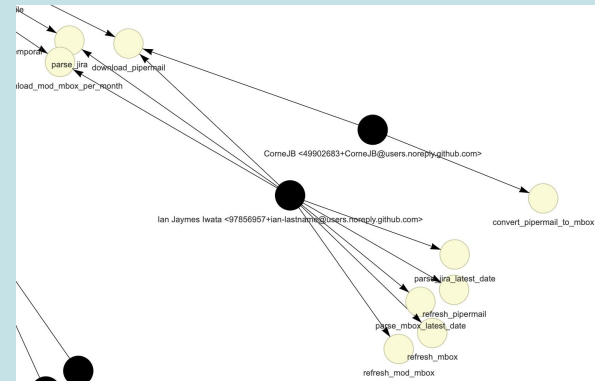

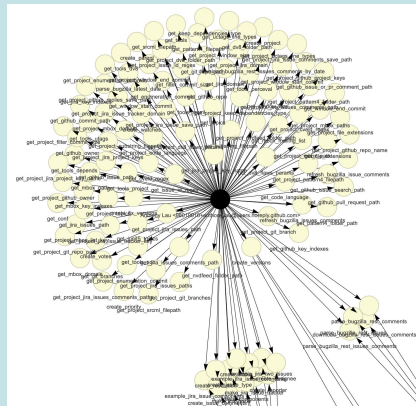

- Improved existing functionalities
- Config files/ naming conventions
- Refresher functions
- Scripts for automatic downloading via Cron jobs

Major Accomplishments

Major Accomplishments

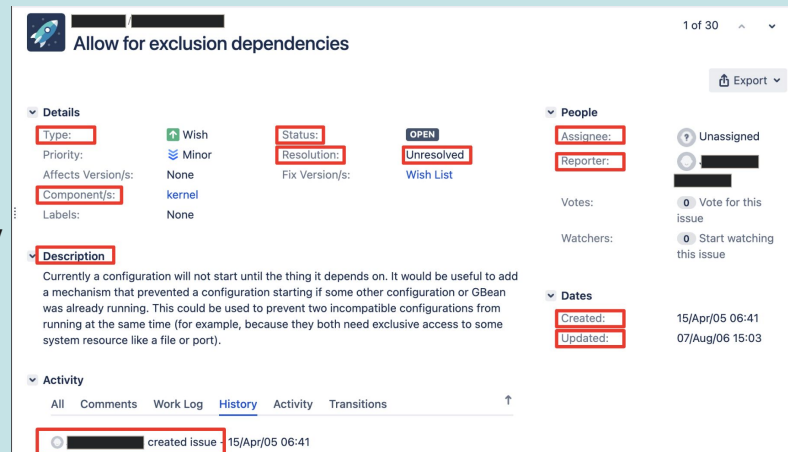

Improve Existing Functionalities

- JIRA parser
 - Parses all json files in a folder in correct format
 - Added previously missing fields

- JIRA fake data generator
 - Used to unit test downloader's parsers
 - Removed use of third party dependency
 - Formats fake json file in same way as API calls
- Adheres to format downloaded from API
 - Important to not modify data downloaded

Config Files/Naming convention

- Naming Convention
 - identifier_[UNIX start time]_[UNIX end time].json
 - Allows identification of file containing latest data by only parsing file names

- Config File Get Functions
 - Get functions for config file values
 - Easier to propagate changes in config files to notebooks

Config File

Get Functions

Kaiaulu Notebooks

Refreshers

- Solution to obtain new issues/comments posted since last download
 - 1. The rest API rate limit is reached.
 - 2. Function ends before completing.
 - 3. More issues were since posted after downloading.
- Refresh functionalities for various endpoints
 - Github
 - JIRA
 - Bugzilla
 - Mail Archives

Scripts/Monitoring

- Wrapper scripts callable from the command line
- Allows for automatic retrieval of new data in time increments
- Cron jobs call scripts every x minutes

Quality Assurance Metrics

- Unit Testing
 - Test input and output of functions
 - Ensure that config files provide correct information
- End-to-end Testing
 - Check that correct data downloaded
 - Parse existing data into tables

Project Management and Delivery

- Project Management
 - GitHub Issues for conceptual discussion of problem and solutions
 - GitHub Discussions for user issues and discussion
 - GitHub code reviews
 - GitHub repo for meeting notes and agenda
- Communication
 - Discord server with sponsor
 - Weekly meetings
 - Monday/Wednesday 5pm - students
 - Friday 3pm - students + sponsor

Reflection

- Challenges
 - APIs behaved differently than expected
 - Led to evolving milestone requirements
 - 'Search' APIs have limitations
- Technical/Soft skills
 - R/Rstudio
 - Familiarity using different API endpoints
 - GitHub issues and pull requests
 - Regular communication and feedback
 - Navigating open source software on GitHub

Next Steps

Kaialu is ever evolving

- Unfinished tasks:
 - GitHub events
 - Full functionality of Bugzilla parser
 - Specify month in endpoint for mail downloaders/refreshers
- For future contributors:
 - Add more refreshers
 - Automate more downloaders via scripts
 - Replace more third-party dependencies with own code
 - Navigate API endpoints and their capabilities/limitations

Acknowledgements

We would like to thank our incredible sponsors/stakeholders:

- Carlos Paradis, Ph.D. in Computer Science
- Rick Kazman, Shidler College of Business
